PROFILE

Engineer building complete web products and backend systems, from React interfaces and PostgreSQL workflows to cloud infrastructure and AI-powered applications. Recent work includes a private client request platform, commercial billing and content-generation systems, AWS architecture, and agentic development workflows. Earlier experience in embedded systems and electrical engineering informs a practical, systems-focused approach.

TECHNICAL SKILLS

Languages & frontend: TypeScript, JavaScript, Python, C++; React, Next.js, Tailwind CSS, responsive UI development

Backend & data: Node.js, Express, FastAPI, REST APIs, PostgreSQL, MySQL, DynamoDB, Redis, Drizzle ORM, Prisma, Server-Sent Events

Cloud & delivery: AWS Lambda, ECS/Fargate, Step Functions, S3, IAM, API Gateway, Cognito, Bedrock; Docker, Railway, Vercel, GitHub Actions

AI & tools: Governed agent loops, harness engineering, multi-agent orchestration, RAG, tool calling, LangChain, LangGraph; Playwright, Git, Cursor, Claude Code, AWS CLI

Embedded systems: ESP32/ESP8266, IoT prototyping, Altium PCB design, 3D printing

PROFESSIONAL EXPERIENCE

White Label Resell | AI Backend Engineer

Remote, Los Angeles, CA | January 2025 - Present

Private client request platform

- Built a full-stack request system with a client portal and internal delivery workspace using React, Next.js, TypeScript, PostgreSQL, Prisma, and Auth.js.
- Implemented ticket intake, a Kanban board, comments, attachments, activity history, assignments, sprint planning, reusable UI components, and server-side workflow actions; added unit and Playwright end-to-end tests.

SEO Content AI - commercial content platform

- Built a parallel article-generation orchestrator, modular generators for nine content formats, and a deterministic assembler for a platform release and AI Site Builder integration.
- Reduced bulk-generation time by approximately 90% with fair concurrency for up to 40 simultaneous articles and real-time progress streaming over SSE.
- Built Stripe billing infrastructure and UI, including atomic credit transactions, monthly plan allocations, per-component billing, and feature gating.
- Built browser and database checkpoints that reconnect and resume interrupted generation jobs.

White Label Resell | Continued

Governed agent workflow

- Architected a five-phase build loop combining read-only Pi agents for codebase analysis, confidence scoring, an isolated implementer, and Steel.dev Playwright verification before GitHub PR creation.

AWS architecture and automation

- Designed a serverless proof of concept for a role-based operations platform for approximately 100 users, with API specifications, VPC and database partitioning plans, cloud cost models, and an interactive architecture brief for client review.
- Built lead-capture automation with traffic attribution, Google Sheets and GA4 synchronization, and weekly reporting to replace a paid tool.

Nigeria Communication Satellite (NIGCOMSAT) | Navigation Department Intern

Abuja, Nigeria | May 2024 - March 2025

- Inspected RF equipment and assisted with satellite navigation monitoring, technical operations, and documentation for NigComSat-1R.

National Centre for AI & Robotics (NCAIR) - NITDA | AI & Embedded Systems Intern

Abuja, Nigeria | February 2022 - July 2022

- Built an automated microscopy capture prototype for an ML-based malaria-detection project using ESP32/ESP8266, Altium-designed PCBs, and 3D-printed parts; contributed to CNN model training and validation.
- Designed and fabricated PCBs with Altium and CNC tools, soldered components, and developed microcontroller and 3D-printed robotics prototypes, including an Otto robot and robotic arm.
- Delivered hands-on STEM workshops for children through NITDA's SB4Kids program, introducing IoT, robotics, and programming.

SELECTED ENGINEERING PROJECTS

IoT Solar Tracking System | Final-year project

- Designed and built a solar tracker that adjusts panel orientation with the sun; used ESP8266 and ThingSpeak for remote monitoring and control through a web interface.

Facial-Recognition Attendance API

- Built an attendance API using FastAPI, PostgreSQL, and SQLAlchemy, integrating facial recognition with database-backed attendance records.

EDUCATION

Federal University of Technology Minna | B.Eng., Electrical and Electronics Engineering

Graduated February 2024 | Second Class Upper Division
